

SpinFlag Supply Level Indicator Instructions for Use

Your bin, shelf, cabinet or drawer is loaded with product and your indicator is set to green, signaling that your supply level is sufficient for a particular item(s).

When your item in the bin, on the shelf, in the cabinet or drawer drops below your specific stock level, the bin flag is manually set from green to red by turning clockwise. Now the red is a quick visual indicator that easily identifies which supplies are in need of reordering.

If a barcode is affixed to the front of the bin, shelf, cabinet or even to the front of the indicator it can be scanned for reordering. When the barcode has been scanned the red flag can be set to yellow by turning clockwise again, which indicates product has been scanned or ordered. Everyone is aware product is on its way!

The replenishment supply is scanned if using scanning technology and loaded back into the bin.

The yellow indicator is turned clockwise again so the green is exposed, allowing a normal supply process to continue.
